OnDemand World Observatory

Realistic, real-time imagery
for websites with existing world settings

Team: FlyPig AI / Author: M.K. Hsu
Creator AI / Battlefield Lightning / Global Online Track

28 October 2026

Repeat visits need fresh moments

Creator

A rich world setting and reference art already exist. Manually writing every new scene takes effort.

Visitor

A fixed gallery repeats the same moments. An open-ended prompt editor asks the visitor to do the work.

Proposed value

A new observation on opening, bounded by the creator's world rules and visual identity.

Initial customer hypothesis: independent worldbuilding creators and small IP teams

The proposed observation flow

01 — **Open page**

02 — **Compose scenario**

03 — **Generate clip**

04 — **Play new result**

World settings + eligible subjects + time + climate + reference images

A new contextual moment, planned from the creator’s world and existing artwork.

Creator-defined context and constraints

01 World facts

One domain, eligible species or characters, visual references and event rules.

02 Context snapshot

Creator-defined fictional time and climate in the first version.

03 Coherence checks

Reject unsupported species or conditions before requesting a video.

A written example

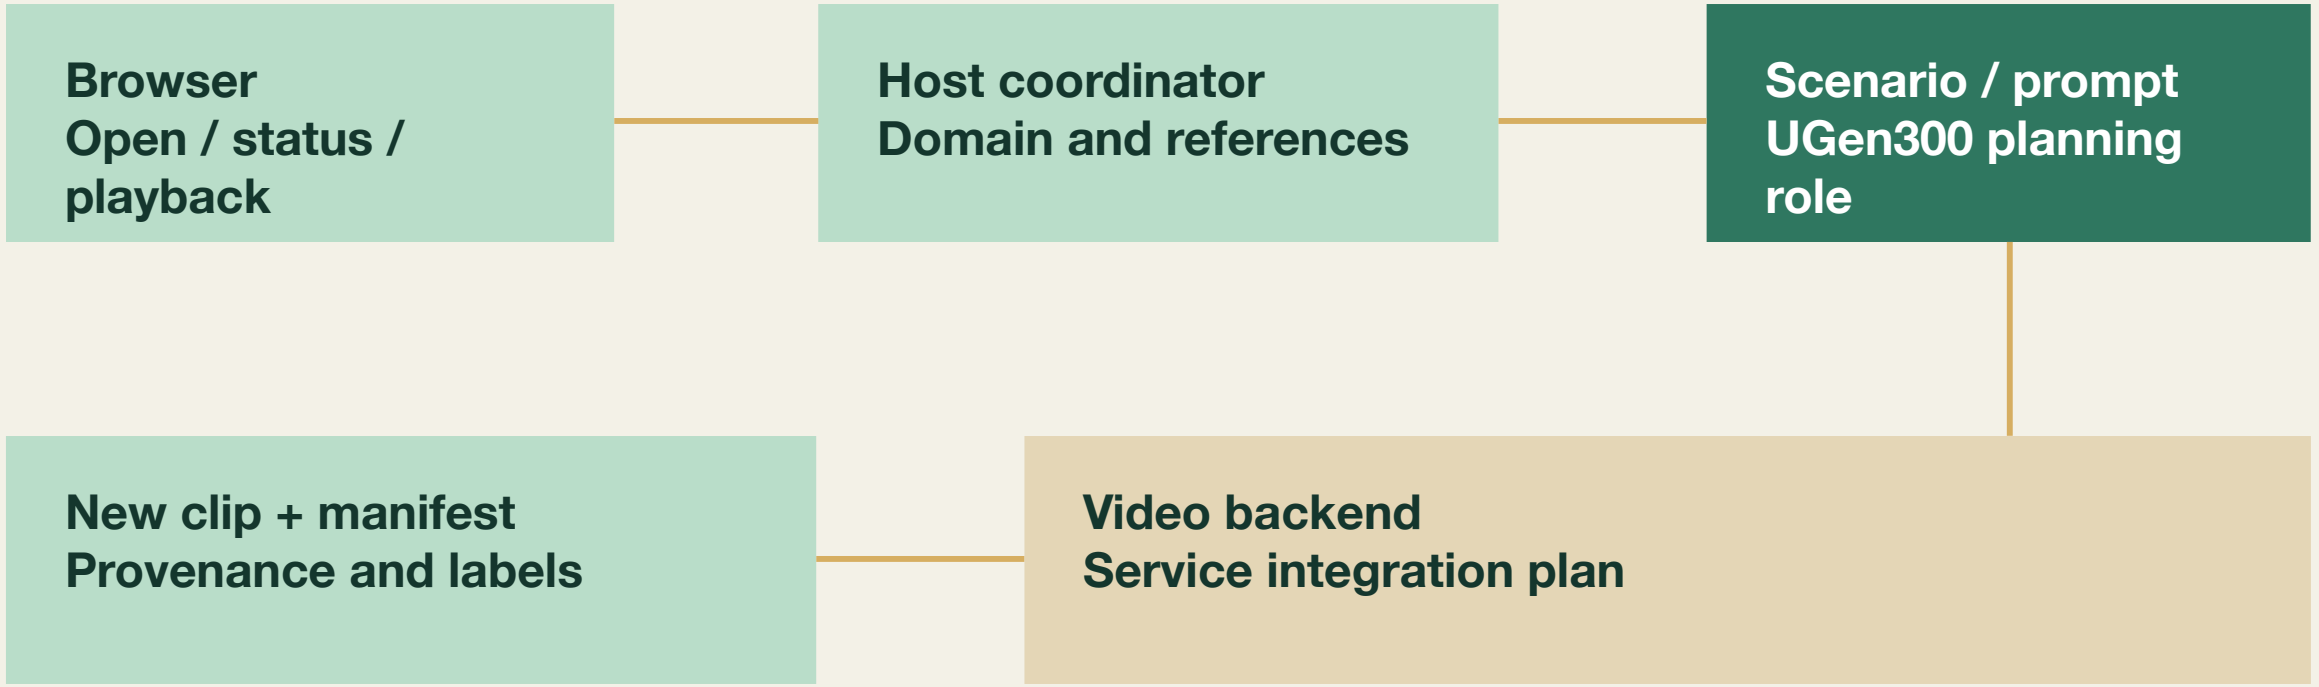

FICTIONAL WETLAND / DAWN / MIST

One approved wading bird takes two slow steps beside reeds. Gentle ripples cross still water.

Prompt direction: preserve the reference anatomy and habitat.
Use a fixed wide camera, subtle motion and no additional species.

Illustrative scenario for the planned reference-conditioned workflow.

Proposed software and hardware architecture

The planned architecture separates context planning, video generation and website playback.

UGen300 evaluation scope

Candidate role

Context interpretation and constrained scenario / prompt construction using a supported Hailo-10H model.

Compatibility gate

Confirm received device, host OS, drivers, memory and model runtime. USB versus M.2 selection remains pending.

Evidence needed

Actual device operation, model versions, reproducible logs and separate timings for every pipeline stage.

Development will evaluate model support, runtime compatibility and pipeline performance.

Reference material and planned development

Existing visual references

K’s Hunting Log
Habitat artwork
Species settings
Published concept clips

Planned observation system

Page-open observation requests
World rules and scenario planning
Reference-conditioned prompts
Video-service integration
Embeddable website component

Reference credits and rights information accompany the project materials.

Website observation component

01 Scene configuration

Operators select the domain, references, eligible subjects, time and climate options.

02 Observation experience

The component would show request status, video, context and another-observation controls.

03 Website integration

The planned component would embed into story, character, location or brand pages.

Commercial hypothesis and pilot

First buyer

Independent creators and small IP teams with established worlds

First use case

An observation page linked from an existing world or story site

Possible model

Creator subscription plus metered video use or observation credits

Measure cost per playable clip, retries, visitor return intent and creator effort.

Proposed validation and acceptance gates

Coherence

20 context combinations × 5 requests. Review species, reference identity and forbidden events.

Performance

Measure context, device prompt inference, video backend and total time-to-play separately.

User value

Proposed study: 5 creators and 10 visitors. Compare fixed clips with labeled variations.

Proposed gates: complete provenance, no unapproved species in accepted prompts, honest failures

Stage II development plan

06–13 Nov	Device and model compatibility baseline
14–20 Nov	Context, constraints and device prompt step
21–27 Nov	Eligible video backend and playback integration
28 Nov–04 Dec	Evaluation, actual device capture and final evidence

Eligibility and rights decisions

01 Prior public and similar works

The consent warranty includes similar public works by the same author. No old-material exemption is confirmed.

02 Asset and model permissions

Rights must support the organizer’s use, including commercial use and sublicensing for winning work.

03 Owner-only agreement and signature

The author must review perpetual award licensing and name, likeness and voice terms before signing.

Development plan and project resources

Project materials

World-rule and interface plans
Scenario and data examples
English proposal and storyboard
Source and reference register

Next development steps

One domain and reference set
UGen300 context planning
Video-service integration
Embeddable website component
